

Crosspod

One confirmed record of every order a small supplier receives, built from the PDFs and WhatsApp messages it already gets.

CS3216 · Group [N] · Pitch for the coolness points · September 2026

77,600	1.66 M	14.5%	2
Singapore companies, S\$1M–S\$100M	people they employ	SME AI adoption (IMDA)	suppliers in pilot talks, first demo Monday

THE PROBLEM

A machining supplier, Woodlands

26 machines, 50-odd production staff. Orders arrive as PDFs in 20 customer layouts and one person keys every line in. Revisions and due dates come over WhatsApp, across about a hundred groups. Their last software, bought on a government grant, was abandoned because it needed data entry.

A produce supplier to hotels

80 to 100 orders a week. Most arrive as PDFs from the hotels' purchasing systems, the rest as WhatsApp messages from restaurants. Six salespeople retype them into Excel. When one is on medical leave, the manager types.

"My customers must not have to change a thing."

The produce supplier's manager, her one condition for any new tool.

Nobody builds for them

Everything shipped from San Francisco and Paris assumes an IT team and software with APIs. IMDA puts SME AI adoption at 14.5%, most of it pasting into ChatGPT.

THE PRODUCT

Crosspod turns what a supplier already receives into one confirmed record the whole company works from.

- Nothing to install.** Share a Drive folder, connect a WhatsApp number or upload a chat export. Customers change nothing. Email forwarding is the next connector.
- Nine record types built for suppliers.** Sales orders, clients, items, suppliers, supplier orders, specifications, conversations, meetings, files. Read out of PDFs, scans and chats.
- Every record cites its source.** A record starts as a proposal, each line pointing at the passage it was read from. A person confirms it, and every confirmation is logged: who, when, and whether it was one record, a batch, or the extractor itself.
- Five nightly checks.** A source that changed under a record. An order untouched for 14 days. Something

mentioned often with no record. A reference to a record that does not exist. Two sources that disagree.

- Ask it.** Questions are answered from confirmed records, with the passages cited. ChatGPT and Claude access is the next ticket.

THE MARKET

Revenue band, 2024	Companies	Employed
> S\$100M	4,300	1.03 M
S\$1M – S\$100M (Crosspod)	77,600	1.66 M
≤ S\$1M	276,500	0.70 M

Where Sierra stops

Sierra, valued at \$15.8 billion, opened a Singapore office in November 2025 for the 4,300 companies above S\$100M: Grab, Singtel, six-figure contracts, each set up by a forward-deployed engineer.

Where we start

The 77,600 companies below that line pay a few hundred dollars a month. Teaching a system one shop's 20 order layouts is custom work, and no \$15 billion company sends an engineer to Woodlands for it. We will. The twenty-first layout is free.

Why they stay

After two years of orders, revisions and confirmations, switching means starting the company's memory over.

LESSONS FROM THE INDUSTRY

In September one of us went to AGNTCon and MCPCon Europe in Amsterdam, then AI Engineer Paris, to meet the teams building context layers for companies.

Amsterdam, 23 Sep 2026. One of us outside Input's office with the Input team.

Input, Amsterdam. Office visit.

Ex-Lemni, Sequoia-backed, moved from customer-service agents to an AI-native email client. Their bet is ours: the context under the app is the product and the app is replaceable. They are taking Gmail first, then meetings, then all of Google Workspace, and told us enterprise-scale context is still unsolved. **We kept the design and narrowed it to one object, the order.**

Dust, Paris.

3,000-plus organisations, \$40M Series B from Sequoia in May. Connects Slack, Notion, GitHub and Salesforce; employees build agents on the shared context. **We kept one rule: shared context only works when the whole team can see and correct it, so our review queue is open to everyone with access.**

Jonathan Bordereau, co-founder, Cominty. AI Engineer Paris.

Cominty, Paris. Expo stand.

Co-founder Jonathan Bordereau told us Cominty had just refocused on the context layer too. **We kept their layering: ingestion, permissions, logging and model choice stay separate. We swapped the embedding model without touching the rest.**

From the talks

- **We dropped our own gateway.** 14 of 89 Amsterdam talks were about MCP gateways, from AWS, Google and Booking.com. A Dutch heating company audited

856 tools and found 97% of descriptions flawed. Crosspod will expose its record over MCP, read-only, and nothing more.

- **The search page is gone.** Our first MVP was a wiki with hybrid search. Garry Tan had open-sourced that exact design and our own ticket calls the page "useless". Questions are answered from the record now, with citations.
- **We will never own a mail client.** One inbox is 20 to 30 GB, Input told us. Customers forward, export, share. A live demo of a WhatsApp MCP server hijacked by a second server on the same machine was the other reason.
- **Confirmations are logged, not assumed.** OpenAI asked which version of the world an agent acts on once a human edits mid-flow. Every confirm is now an event: person, batch or auto, with who and when.
- **No Neo4j.** Its fine-grained access control is Enterprise-only, and our machining customer forbids production staff seeing cost data. Links between records live in a Postgres table instead, where per-person visibility is a migration, not a licence.
- **A test set modelled on real work.** GitHub and Datadog both said real-work test sets beat public benchmarks. Ours is modelled on that: a seeded Drive and generated WhatsApp exports, 50 labelled questions plus 15 question shapes taken from the interviews, scored for recall every night with a regression gate that raises a finding when the number drops.

THE ASK

Both suppliers see Crosspod next Monday. The question we are asking them is "will you pay."

The test account is yours too. Log in, ask it the fifty questions, and see whether it lies.
